

SCHAEFFER

Access control

EKS 42 Mega/EKS 50 Mega

Access Control System

Characteristics

Description

The system consists of a central unit, the EKS Mega, and several MegaBeans which are connected to it within a fixture, COP-Panel, or similar. It manages up to 255 transponder identifiers. For each authorized transponder any combination of connected control devices (MegaBean + button) can be activated.

Optionally the reading procedure of a transponder can be signalled optically with the EKS Mega. Acoustic signals confirm all actions, especially operation of controlling devices if no valid transponder was detected.

Assembly is possible both during fixture production as well as retrofit for existing installations of any manufacturer, as long as the electrical requirements (voltage range, current consumption of recall light) are met.

The application profile can be changed easily and quickly on site. It is also possible to delete lost transponders from the system without any additional hardware.

Power supply

20 V ... 30 V DC smoothed

permissible output current of the system

max. 2 A

Temperature range

-25 °C ... +65 °C

Number of participants

max. 255 transponder identifiers

EKS 42 Mega central unit

EKS 50 Mega central unit

MegaBean switching module

EKS 42 Mega/EKS 50 Mega

Transponder

ISO-Card

KeyTag

BlueTag

StrongTag

Transponders with key function are available in four variants:

- ISO-Card "KeyCard"
- key ring pendant "KeyTag"
- key ring pendant "BlueTag"
- key ring pendant "StrongTag"

All four variants have identical functions.

Every transponder (electronic key) is a unique specimen with a non-recurring and unchangeable identifier.

Particular transponders can be deleted from the memory of the EKS Mega. Additional transponders can be stored into the EKS Mega on site.

The EKS Mega can memorize up to 255 different transponder identifiers.

As a rule, the EKS Mega is being delivered ready for installation, i. e. the enclosed transponders are stored in the memory of the EKS Mega and the desired configuration is set.

By means of the optionally available special function cards

- ProgrammingCard
- ResetCard
- DeleteCard

the configuration of the EKS Mega can be modified.

Customized designs available on request.

EKS 42 Mega VP

Central unit, vandal-resistant

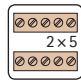

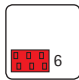

Characteristics

When mounted behind a stainless steel faceplate there is no need for a cutout for the EKS 42 Mega in the faceplate. The reader unit will be fixed at the rear of the faceplate by means of welding studs and the reading area will be marked on the front of the faceplate in any way.

This variant is advantageous for example in connection with large push buttons or non-SCHAEFER products to be independent from the design.

With no access from the front the device is furthermore safe from manipulation, thus save from vandalism, water and dust.

EKS Mega/MegaBeans

Mounting / Installation

Characteristics

EKS Mega and MegaBeans are mounted at the rear of the faceplate. Depending on the Style, the central unit is fixed by means of welding studs or by clip fixing and the fixing plates of the switching modules MegaBean are fixed to the faceplate by an adhesive bond.

Via a 6-pole ribbon cable with Micro-Match type connectors the EKS Mega is connected with the MegaBeans. These connectors fit any way. Each button, which is meant to be included in the access control system, needs an own MegaBean. The MegaBeans are connected between button and controller. Thus it is also possible to retrofit existing fixtures.

EKS 42 Access/EKS 50 Access

Topology

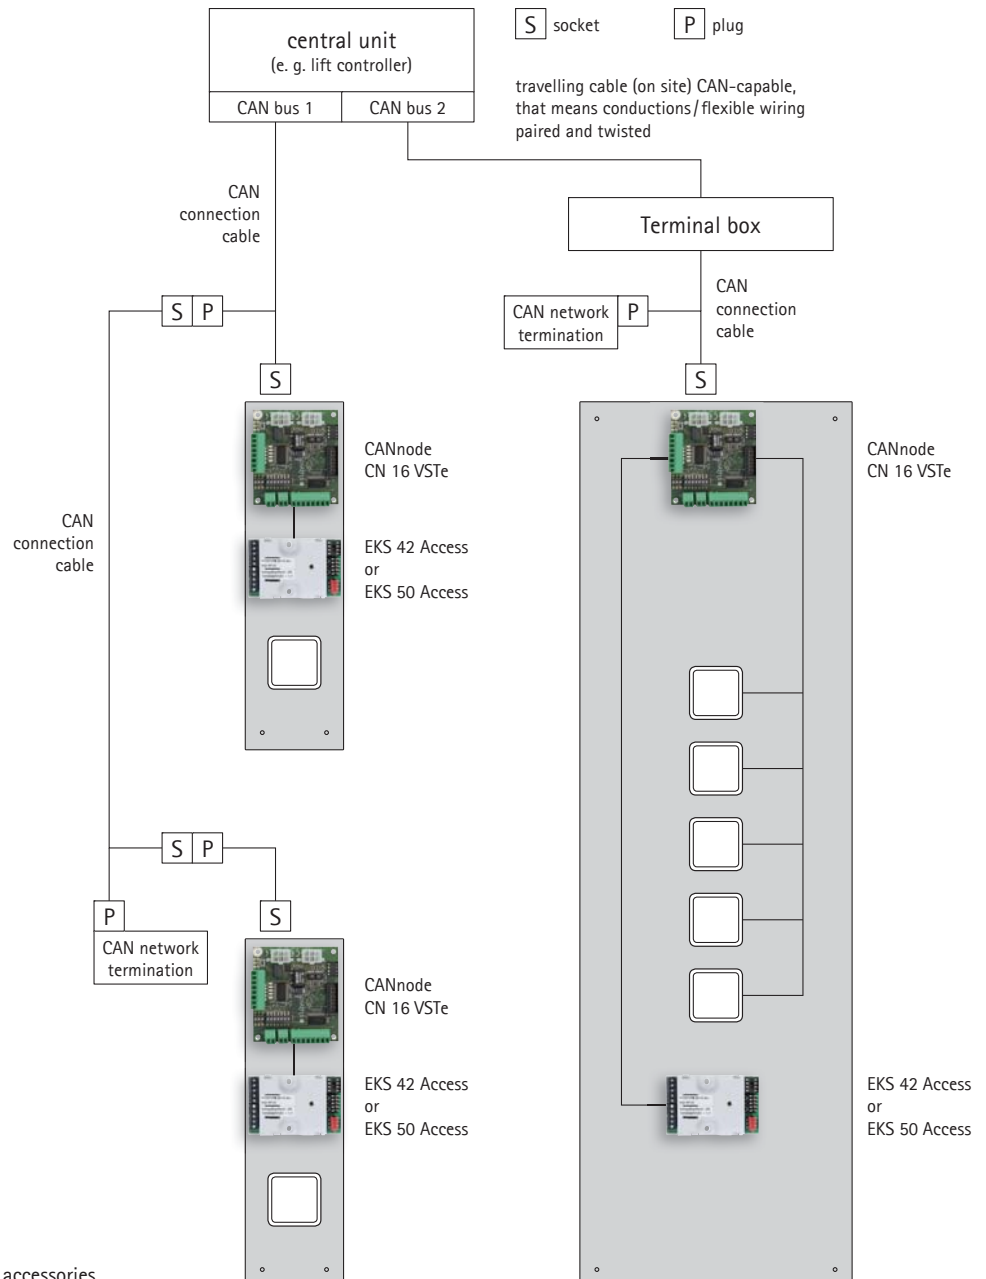

Description

EKS 42 Access respectively EKS 50 Access is employed for access control systems with centralized control.

The key card is read in by the reader unit of the EKS 42 Access/EKS 50 Access and its identifier is sent to the connected CANnode CN 16. This node transfers the data to a central unit which decides about the access authorization. The data with the result is sent back to the CANnode CN 16. Then the CANnode releases the respective call buttons; this can be visualized by a flashing recall light. At the same time, EKS 42 Access/EKS 50 Access receives a corresponding confirmation signal and can thus signalize release or denial by means of LEDs.

The key cards need to be read in to the central unit only once and are then valid for the entire system.

EKS 42 Access/EKS 50 Access

Transponder

ISO-Card

Transponders with key function are available in four variants:

- ISO-Card "KeyCard"
- key ring pendant "KeyTag"
- key ring pendant "BlueTag"
- key ring pendant "StrongTag"

All four variants have identical functions.

Every transponder (electronic key) is a unique specimen with a non-recurring and unchangeable identifier.

Saving and deleting of transponders as well as determination of authorizations is done in a centre that corresponds with the CANopen protocol.
